BMW PRODUCT INTELLIGENCE

Agents prepare. Product managers decide.

2023 BMW i5 M60 by Nazh Design / Sketchfab · CC BY 4.0 · independent artist model

BMW
PRODUCT INTELLIGENCE

LIVE · G60 / i5 M60 · US MARKET · 4,365 FEEDBACK ROWS

Every requirement has to survive three questions.

01 **Where did it come from?**
One click to the customer's own words

02 **How sure are we?**
Priority and proof, scored separately

03 **What changed since we decided?**
Only affected decisions come back

LIVE DEMO NEXT

Agents prepare. Product managers decide.

AUTOMATED

Import feedback, link every proposal to its source rows, score it with a versioned rubric

SURFACED TO THE PM

Weak evidence, a dominant source, targets that are only assumptions

PM ONLY

Approve, edit or reject the exact version. AI approvals are refused. Every step is audited.

NEXT Any *Baureihe*, any market · the same operations as scoped agent tasks over MCP · built to feed Codebeamer

What the sample can and cannot say

Shown before any proposal, so counts are never read as market share.

IMPORTED

4,365

G60 / US feedback rows from the selected BMW files

ONE SOURCE

72.74%

of unique feedback IDs come from Source B (2,626 of 3,610); 60.2% of rows

PROPOSALS

11

source-linked requirement proposals in the opening demo state

> Rows and feedback IDs are sample evidence, not customers or market prevalence.

Where the charging proposal came from

REQ-G60-US-001 · every link resolves to workbook, sheet and row.

264

linked evidence records with exact locators

12

checked by hand against the archived workbook

G60_feedback_hackathon.xlsx · Feedback_Explorer

Search and routing	rows 2141 · 4245 · 1932 · 2382
Charger availability	rows 432 · 1945 · 4764
Compatibility	rows 3383 · 193
Positive experience	rows 1692 · 4802
False positive	row 4357 is phone charging. The PM sees it and can reject it.

> The rows support separate signals. The combined in-car route journey is a PM hypothesis that needs validation.

Priority and proof stay separate

A high score with weak evidence must look different from a proven one.

PRIORITY

71.26

Deterministic rubric `customer-priority-v1`. Same inputs, same score. Some factors are heuristic or PM-assumed.

EVIDENCE GRADE

C

Selected, undated and concentrated feedback with conflicts. Never mixed into the priority.

TARGET

80%

Task success in a moderated US trip-planning test. Labelled PM assumption: no study establishes it.

Only a PM can decide

The decision binds one exact requirement version and its score.

AI APPROVAL

403

An approval from the AI actor ai:reference:v1 is refused by the API.

PM DECISION

v2

Approve, edit or reject the exact version and score, with a written rationale.

AUDIT CHAIN

130 → 143

Recorded events before and after the update. The chain verifies in both states.

> In the prototype the actor name is self-declared. BMW SSO and permission mapping come in the pilot.

Only affected decisions come back

A two-year process: new feedback reopens what it touches, nothing else.

NEW INPUT

+1

Synthetic, undated charging record, labelled simulated. Not BMW feedback.

REOPENED

1 of 11

Only the charging proposal returns for review. Ten stay untouched.

THE DELTA

+0.07

Priority 71.26 → 71.33. Wording and target unchanged. Approved v2 stays frozen beside v3.

Built today, pilot next

What we verified for this demo, and what BMW would validate with us.

VERIFIED IN THIS BUILD

- Source-linked proposals for G60 / US
- Versioned deterministic scoring with a separate evidence grade
- Human-only decision gate and verifiable audit chain
- Delta-only re-review after new input
- The same operations over API and MCP

PILOT WITH BMW

- BMW identity, SSO and permissions
- Codebeamer export interface
- Live LLM analysis on BMW's governed model endpoint
- Second market and *Baureihe* comparison
- Measure grounding rate, review effort and time-to-trace

The agent-ready runtime

Integrated platform build. Separate from the frozen G60 / US demo.

REGISTRY

Roles

Specialist agents, each limited to the capabilities granted to it

TASK QUEUE

Scoped

Every task is bound to one vehicle and market; stale writes are rejected

SCHEDULER

Recurring

Recurring checks create one task per due slot

RUN HISTORY

Logged

Inputs, input hash, outputs and errors for every run

> Accepting a task never approves a requirement. Bounded LLM orchestration of these agents is the next phase.
